EDUCATION

International Islamic University Islamabad

Islamabad, Pakistan

BS Software Engineering

2022 – 2026

SKILLS

Languages: C#, Python, TypeScript, HTML, CSS

Frameworks: ASP.NET Core, React (TypeScript), Bootstrap

Backend: REST APIs, Minimal APIs, MVC, CQRS, MediatR, EF Core, ASP.NET Identity, N-Tier, Repository Pattern, AutoMapper, SignalR

Databases: MS SQL Server, PostgreSQL, Code-First Migrations

Tools & DevOps: Git/GitHub, Docker, Nginx, Linux, AWS EC2, Azure App Service, Postman

Concepts: OOP, SOLID, Design Patterns, Clean Architecture

AI / ML: scikit-learn, NumPy, Pandas, Matplotlib

PROJECTS

SyncUp – Social Activity & Event Platform

Live Demo | GitHub

.NET API · CQRS + MediatR · React · TypeScript · Material UI · React Query · EF Core · PostgreSQL · Azure

- Built a full-stack event platform where users can create, host, and join real-time social activities
- Architected backend with Clean Architecture, CQRS, and MediatR — separation of concerns across 3 layers
- Implemented cookie-based authentication with custom middleware for centralized error handling across 15+ API endpoints
- Integrated Cloudinary for photo uploads and React Query for efficient client-side server-state management
- Deployed via Azure App Service with GitHub Actions CI/CD pipeline for automated builds and zero-downtime releases

AsciiArtify – Containerized Deployment Architecture

Live Demo | GitHub

AWS EC2 · Docker Compose · Nginx · Linux · .NET 9 · React

- Engineered a multi-container deployment pipeline on an AWS EC2 micro-instance, utilizing Docker Compose to isolate a .NET REST API and a React frontend
- Configured an Nginx reverse proxy to serve static client assets and securely route internal network API traffic, entirely eliminating backend CORS dependencies
- Managed Linux kernel resource constraints by manually allocating virtual swap memory and expanding EBS volumes to support memory-heavy build processes without triggering OOM panics
- Optimized deployment artifacts by implementing multi-stage Docker builds, separating the SDK environments from the final lightweight production runtime containers

Formoptix – AI-Based Exercise Form Correction (Final Year Project)

GitHub private for now

Python · scikit-learn · Pose Estimation · Logistic Regression · Finite State Machines · On-Device Inference

- Collected and labeled a custom dataset of 600+ pose-landmark samples across push-up and bicep curl exercises for supervised model training
- Studied published research on pose-based exercise classification to design a feature pipeline combining joint-angle calculations with a finite state machine (FSM) for rep-phase segmentation
- Engineered angle-based heuristics layered on the FSM to count reps and flag incorrect form in real time
- Trained and evaluated logistic regression classifiers in scikit-learn, achieving up to 90% accuracy
- Deployed the trained model for real-time, on-device inference in a mobile application
